

AWS Global Accelerator

AWS Global Accelerator

Improve global application
availability and performance

AWS Global Accelerator uses AWS' vast, highly available and congestion-free global network to direct internet traffic from your users to your applications running in AWS Regions. With AWS Global Accelerator, your users are directed to your application based on geographic location, application health, and routing policies that you can configure. AWS Global Accelerator also allocates static anycast IP addresses that are globally unique for your application and do not change, thus removing the need to update clients as your application scales.
