Amazon **WorkDocs**

Content creation, file collaboration and management, simplified

Amazon WorkDocs is a secure, fully managed, content creation, file collaboration and management service, with an extensible SDK, that runs on AWS.

With Amazon WorkDocs, all your files are stored on one service. Users can create content, share files, provide rich feedback, and access their files on WorkDocs from any device. WorkDocs encrypts data in transit and at rest, and offers powerful management controls, active directory integration, and near real-time visibility into file and user actions. The WorkDocs SDK allows you to use the same AWS tools you are already familiar with to integrate WorkDocs with AWS products and services, your existing solutions, third-party applications, or build your own. You don't have to worry about deploying updates, or patching software, and can scale users and storage up or down with a few clicks. WorkDocs offers low, pay-as-you-go pricing for users and storage, and no charge for API calls. There are no upfront commitments or long-term contracts.
